PT DNA encoding plant morphogenesis regulatory protein - useful to present with short stems or altered inflorescence PS Claim 6; Pages 12-15; 17pp; Japanese.
Claim 6; Pages 12-15; 17pp; Japanese.
CC The present sequence encodes an Arabidopsis thaliana plant companies of the present sequence of the present sequence which can be used to morphogenesis regulatory protein (MRP), which can be used to morphogenesis regulatory protein (MRP), which can be used to morphogenesis regulatory protein (MRP), which can be used to morphogenesis regulatory protein (MRP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The MRP acts on a plant at a specific site for a specific period, and can therefore be used to regulate extraneous gene expression in a plant. The MRP's cDNA or genomic DNA can be used to transform a plant to increase its MRP expression, and therefore control the form (particularly stem length) of the plant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plant yield or vegetative biomass and increased seed yield. Expression of Binl may also increase resistance to pesticides. Inhibition of Binl, e.g. using antisense oligonuclectides (AON), is used to render plants male-sterile, and to reduce their stature or yield, e.g. for creating dwarf varieties. Since Binl homologues may be involved in regulation of the menstrual cycle and uterine function, Binl, antibodies and AON may be seful as contraceptives, for improving success of in vitro fertilisation and to prevent premature labour. Transgenic animals are also provided, and are models for studying steroid-receptor interactions or can be used
                                                                                                                                                                                                                                                                                       6005

This invention describes a method for conferring disease resistance plants. The invention describes the use of novel genes and proteins belonging to the Oryza longistaminata and Oryza sattlya receptor kinase-like protein (RRK) Xa21 multigene family. Such genes from cassava, maize and tomato are also described. The genes and proteins
                                                                                                                                                                                                                                                                                03-AUG-1998 (first entry)

The shoot tips including any emerged leaves were harvested for mRNA isolation. The CDNA library was prepared using the Stratagene pBluescript II XR CDNA library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly (dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The CDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into XLIO-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John Erpelding."
